

Mt Ellis

Date

Sat, 02/13/2021 - 18:21

Activity

Skiing

A little wind slab forming along the ridge, and wind was picking up during the day. Lower elevations snow is still fairly weak to ground.

Dug a quick pit at the summit on NW facing aspect. ECTX. Still seeing weak facets near ground with stronger (4F/4F+) mid pack on top. No other significant signs of instability. New snow skied well though I could see wind slab increasing if wind continues through the night.

Region

Bridger Range

Location (from list)

Mt Ellis

Observer Name

Chris Pierce
