Activity

Skiing

Skied Flanders mountain today. Dug a snowpit on a SE facing 24 deg slope at 9700 feet. ECTN24 30cm down on a layer of facets just under an ice crust. Snow above the ice crust was 4F- at most and not hard enough for anything to propagate.

Winds were moderate and gusty, transporting a decent amount of snow but not really forming any slabs other than at the ridgeline. I triggered a shallow 2-3cm deep windslab about 20 feet wide just below the ridgeline. I was not on a steep slope, so it barely moved. Partner and I skied 4 laps in the bowl, skiing was great, didn't see any other signs of instability.

Region

Northern Gallatin

Location (from list)

Flanders Creek

Observer Name

Mike Lavery
