

## More supportable, but still weak

Date

Thu, 01/04/2024 - 13:10

Activity

Skiing

Toured on a lower shoulder on the east side of Cedar Mtn from approx 8600-9600 ft. We found a little bit more of a supportable [slab](#) than we've been seeing on other recent field days (Taylor Fork, Bacon Rind, Beehive Basin) but still not enough [slab](#) cohesion for [propagation](#) in Extended Column Tests. Dug five pits between 9000 and 9500 ft on SE, E, and N aspects - got a mixture of ECTX and ECTN results. Snowpack ranged from 1-2.5 ft deep. The snowpack was generally supportable on skis, but stepping out of skis we plunged to the ground. Light snow fell throughout the afternoon with little accumulation.

Region

Northern Madison

Location (from list)

Cedar Mtn.

Observer Name

Ian Hoyer
